

AQUA COULEUR – USER GUIDE

Please read these instructions carefully and please do not hesitate to contact us if you have any questions or queries.

Aqua Couleur is a temporary water colourant; it does not affect the balance, transparency or quality of your pool water. It is totally hypoallergenic and will not cause ill health if accidentally swallowed in its diluted form. This product has been vigorously tested in collaboration with the pharmaceutical department of the French National Research Centre.

Preparation of pool for colouring – This is vital for a successful party

Before using Aqua Couleur it is **vital** to reduce your chlorine/bromine levels to **below** 1ppm, this level must be consistent throughout the **whole of the pool circulation system**.

1. Calculate your pool turnaround.
2. Make controller set point below 1ppm.
3. It is recommended to add the necessary amount of Premio to speed the reduction of chlorine/bromine. (leave for at least two hours to allow to work) especially in strainers before the filters as these can contain a lot of chlorinamines. We would also suggest putting it in areas of the pool where circulation may be poor.
4. Allow for complete pool turnover time to expire and ensure that the control system is measuring below 1ppm, and **THAT ALL WATER** in the pool system is measuring below 1ppm. **If any pockets of water have a residual over =>1ppm then colour will quickly dissipate.**

Colouring your pool

To colour your pool add the relevant quantity of aqua couleur through a skimmer whilst leaving the filtration system running, colour should spread quickly.

It is important to colour your pool with the correct amount of product, below is a table to guide you, however please note that there are variations in treatment depending on the colour used due to pigmentation differences. Please use this table as a guide only.

Cubic Meters	Product Volume
0.75 m3	15ml
1.5 m3	30ml
50/70 m3	180ml
150/170m3	528ml
250/270m3	859ml
350/370m3	1188ml
450/470m3	1518ml
550/570m3	1848ml

Removing the colour in your pool

Colour will fade with time, however to speed up the removal adjust your chlorination system and colour will quickly dissipate, returning your pool to its original state.

Troubleshooting

I poured the bottle into the pool and the colour was really nice but it only lasted 10 minutes.

The most likely cause is that the level of chlorine in your pool was too high. Have you checked and confirmed a chlorine level less than 1ppm?

We recommend that you lower your chlorine/bromine level for future uses and to neutralise using Premio. Also with the help of a testing kit check the chlorine/bromine level is less than 1 before using AQUAcouleur.

AQUA Premio is a product specially designed to help decrease your chlorine/bromine level quickly and efficiently and therefore prepares your pool for a colouring. Please use in areas of poor circulation or where a high chlorine level is expected e.g. the filters.

Our colour is fading

The colour is designed to gently fade away however; it could be due to there being chlorine in the circulation, possibly in the filters. Please check that your injection set point is below 1ppm.

Please check that your whole pool is below 1ppm, and you have an adequate amount of colour for your pool.

Swimming pool operators are responsible for ensuring that the Chlorine and pH levels are maintained within suitable bathing levels.
